analyzing thousands to millions of particles providing a quantitative statistical description of grain size and shape distribution within the specimen The manuscript also offers a comprehensive examination of 2D and 3D particle size and shape descriptors It demonstrates that there is no correlation between size and shape parameters in many sands and that shape descriptors can be reduced to four independent parameters representing sand granulometry at different scales Additionally the use of DIA in exploring the depositional history of two complex calcareous sands is presented The manuscript presents the properties of 30 representative sands including size and shape parameters and fits them to statistical distributions The investigated soils encompass both natural and machine sorted materials particles with regular and irregular shapes as well as siliceous and calcareous sands Physical granulometry of sand particles is compared using 2D 3D DIA and micro computed tomography CT The work demonstrates that DIA offers significant advantages in terms of efficiency for 3D shape analysis while providing an adequate representation of particle sizes and shapes of most sands Finally the manuscript integrates classical geotechnical engineering with computer vision and artificial intelligence Size and shape descriptors are utilized for sand classification through machine learning models This work represents a crucial step toward the automatic machine classification of soils potentially enabling on site classification using smartphones equipped with high resolution cameras
