Localized Excitations in Solids Richard Fisher Wallis, 1968 **Introduction to Solid-State Theory** Otfried Madelung, 2012-12-06 Introduction to Solid State Theory is a textbook for graduate students of physics and materials science. It also provides the theoretical background needed by physicists doing research in pure solid state physics and its applications to electrical engineering. The fundamentals of solid state theory are based on a description by delocalized and localized states and within the concept of delocalized states by elementary excitations. The development of solid state theory within the last ten years has shown that by a systematic introduction of these concepts large parts of the theory can be described in a unified way. This form of description gives a pictorial formulation of many elementary processes in solids which facilitates their understanding.

Maradudin, 1969 *Spectroscopy and Dynamics of Collective Excitations in Solids* Baldassare di Bartolo, 2012-12-06 This book presents the proceedings of the course Spectroscopy and Dynamics of Collective Excitations in Solids held in Erice Italy from June 17 to July 1 1995. This meeting was organized by the International School of Atomic and Molecular Spectroscopy of the Ettore Majorana Centre for Scientific Culture. The purpose of this course was to present and discuss physical models, mathematical formalisms, experimental techniques and applications relevant to the subject of collective excitations in solids. By bringing together specialists in the field of solid state spectroscopy, this course provided a much needed forum for the critical assessment and evaluation of recent and past developments in the physics of solids. A total of 83 participants came from 57 laboratories and 20 different countries: Austria, Belgium, Brazil, Denmark, Finland, France, Germany, Greece, Israel, Italy, Japan, The Netherlands, Norway, Portugal, Russia, Spain, Switzerland, Turkey, the United Kingdom, and the United States. The secretaries of the course were Stamatis Kyriakos and Daniel Di Bartolo. 45 lectures divided in 13 series were given. In addition, 8 one or two hour long seminars, 1 special lecture, 2 interdisciplinary lectures, 29 short seminars, and 16 posters were presented. The sequence of lectures was in accordance with the logical development of the subject of the meeting. Each lecturer started at a rather fundamental level and ultimately reached the frontier of knowledge in the field.

Normal Modes and Localization in Nonlinear Systems Alexander F. Vakakis, Leonid I. Manevitch, Yuri V. Mikhlin, Valery N. Pilipchuk, Alexandr A. Zevin, 2008-07-11 This landmark book deals with nonlinear normal modes NNMs and nonlinear mode localization Offers an analysis which enables the study of various nonlinear phenomena having no counterpart in linear theory On a more theoretical level the concept of NNMs will be shown to provide an excellent framework for understanding a variety of distinctively nonlinear phenomena such as mode bifurcations and standing or traveling solitary waves **Physics of Structurally Disordered Solids**

Shashanka Mitra, 2013-06-29 Structurally disordered solids are characterized by their lack of spatial order that is evidenced by the great variety of ordered solids The former class of materials is commonly termed amorphous or glassy the latter crystalline However both classes share many of the other physical properties of solids e g mechanical stability resistance to shear stress etc The traditional macroscopic distinction between the crystalline and the glassy states is that while the former has a fixed melting point the latter does not However with the availability and production of a large number of materials in both crystalline and amorphous states and their easy inter convertability simple definitions are not possible or at best imprecise For the present purpose it is sufficient to say that in contrast to the crystalline state in which the positions of atoms are fixed into a definite structure except for small thermal vibrations the amorphous state of the same material displays varying degrees of departure from this fixed structure The amorphous state almost always shows no long range order Short range order up to several neighbors may often be retained although averaged considerably around their crystalline values It is generally believed that the amorphous state is a metastable one with respect to the crystalline ordered state and the conversion to the crystalline state may or may not be easy depending on the nature of the material e g

Localized Excitations in Nonlinear Complex Systems Ricardo Carretero-González, Jesús Cuevas-Maraver, Dimitri Frantzeskakis, Nikos Karachalios, Panayotis Kevrekidis, Faustino Palmero-Acebedo, 2013-11-19 The study of nonlinear localized excitations is a long standing challenge for research in basic and applied science as well as engineering due to their importance in understanding and predicting phenomena arising in nonlinear and complex systems but also due to their potential for the development and design of novel applications This volume is a compilation of chapters representing the current state of the art on the field of localized excitations and their role in the dynamics of complex physical systems
