**Fuzzy Database Modeling of Imprecise and Uncertain Engineering Information** Zongmin Ma, 2008-09-12 Computer based information technologies have been extensively used to help industries manage their processes and information systems hereby come their nervous center More specially databases are designed to support the data storage processing and retrieval activities related to data management in information systems Database management systems provide efficient task support and database systems are the key to implementing industrial data management Industrial data

management requires database technique support. Industrial applications however are typically data and knowledge intensive applications and have some unique characteristics that makes their management difficult. Besides some new techniques such as Web artificial intelligence and etc have been introduced into industrial applications. These unique characteristics and usage of new technologies have put many potential requirements on industrial data management which challenge today's database systems and promote their evolution. Viewed from database technology, information modeling in databases can be identified at two levels: conceptual data modeling and logical database modeling. This results in conceptual semantic data model and logical database model. Generally a conceptual data model is designed and then the designed conceptual data model will be transformed into a chosen logical database schema. Database systems based on logical database model are used to build information systems for data management. Much attention has been directed at conceptual data modeling of industrial information systems. Product data models for example can be viewed as a class of semantic data models. i.e. *Computational Intelligent Systems For Applied Research, Proceedings Of The 5th International Flins Conference (Flins 2002)* Pierre D'hondt, Etienne E Kerre, Da Ruan, 2002-07-31. ### **Intelligent Exploration of the Web** Piotr S.

Szczepaniak, Javier Segovia, Lotfi A. Zadeh, 2012-11-08 The Web is the nervous system of information society As such it has a pervasive influence on our daily lives And yet in some ways the Web does not have a high MIQ Machine IQ What can be done to enhance it This is the leitmotif of Intelligent Exploration of the Web IEW a collection of articles co edited by Drs Szczepaniak Segovia Kacprzyk and to a small degree myself The articles that comprise IEW address many basic problems ranging from structure analysis of Internet documents and Web dialogue management to intelligent Web agents for extraction of information and bootstrapping an ontology based information extraction system Among the basic problems one that stands out in importance is the problem of search Existing search engines have many remarkable capabilities But what is not among them is the deduction capability the capability to answer a query by drawing on information which resides in various parts of the knowledge base An example of a query might be How many Ph D degrees in computer science were granted by European universities in 1996 No existing search engine is capable of dealing with queries of comparable or even much lower complexity Basically what we would like to do is to add deduction capability to a search engine with the aim of transforming it into a question answering system or a QI A system for short This is a problem that is of major importance and a challenge that is hard to meet

### **Domain Modeling-Based Software Engineering** Ruqian Lu, Zhi Jin, 2012-12-06

Many approaches have been proposed to enhance software productivity and reliability These approaches typically fall into three categories the engineering approach the formal approach and the knowledge based approach The optimal gain in software productivity cannot be obtained if one relies on only one of these approaches Thus the integration of different approaches has also become a major area of research No approach can be said to be perfect if it fails to satisfy the following two criteria Firstly a good approach should support the full life cycle of software development Secondly a good approach should support the development of large scale software for real use in many application domains Such an approach can be referred to as a five in one approach The authors of this book have for the past eight years conducted research in knowledge based software engineering of which the final goal is to develop a paradigm for software engineering which not only integrates the three approaches mentioned above but also fulfils the two criteria on which the five in one approach is based Domain Modeling Based Software Engineering A Formal Approach explores the results of this research Domain Modeling Based Software Engineering A Formal Approach will be useful to researchers of knowledge based software engineering students and instructors of computer science and software engineers who are working on large scale projects of software development and want to use knowledge based development methods in their work
