

STRUCTURE OF THE EARTH

- The Earth is made up of four layers:
 - The **INNER CORE** → solid, mostly iron
 - The **OUTER CORE** → semi-molten, mostly iron & nickel
 - MANTLE** → solid upper part, semi-molten lower part (asthenosphere)
 - CRUST** → oceanic & continental, makes up the lithosphere with the upper mantle

OCEANIC CRUST

underlies ocean basins, composed of primarily basalt, thin, very dense

CONTINENTAL CRUST

underlies continents, composed of primarily granite, thick, less dense

THE BENIOFF ZONE

- Zone of seismicity due to the subduction of oceanic plates
- the different speeds and movements of rock produce numerous earthquakes
- the contact between plates at subduction zones is called a thrust/mega-thrust fault
- where the plates are locked together, friction builds up until it is suddenly released as a mega-thrust earthquake
- Often the leading edge can lock (locked fault) and this can hold for hundreds of years before releasing
- this process of strain, stress & failure is the **ELASTIC REBOUND THEORY**
- Zones where there are locked faults can present a significant tectonic hazard

SUBDUCTION

process of a plate sinking underneath another at convergent plate boundaries

SLAB PULL

the oceanic plate being subducted is cold and dense - its own density pulls it down into the mantle

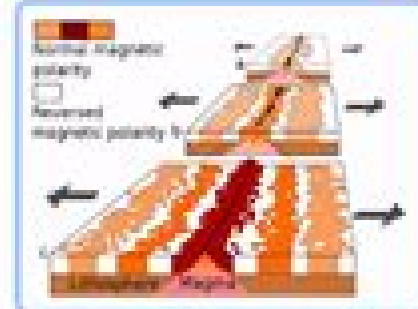

GRAVITATIONAL SLIDING

constructive margins have elevated altitudes due to the rising heat between them which creates a slope down which oceanic plates slide

1.2 theories FOR PLATE TECTONICS

PALAEOMAGNETISM

the study of past changes in the Earth's magnetic field
the poles switch every 100,000 years
when magma cools, magnetic materials inside the rock line up with the Earth's magnetic direction

MAGNETIC STRIPING

- British scientists Fred Vine and Drummond Matthews suggested that magnetic striping was due to palaeomagnetism
- They believed that magma flowing from the mid-oceanic ridges preserved the then-current orientation of the Earth's poles, as the magnetic materials inside the rock lined up with the poles
- seafloor spreading carried new oceanic crust away from the ridge
- Magnetic reversals appear as alternating bands of polarity on the seafloor
- These bands were symmetrical on both sides of the mid-oceanic ridges, suggesting that new oceanic crust is being continuously formed at the ridges

SEAFLOOR SPREADING

- During WWII radar technology was used to map the seafloor, which led to the discovery of ocean ridges and trenches
- Harry Hess proposed that the oceans grew from their centres via seafloor spreading
- Seafloor spreading occurs when two oceanic plates move away from each other allowing magma from the mantle to rise up and form new crust ridges, resulting in the seafloor widening
- However, Hess required more evidence to prove his theory
- this evidence was provided by the study of the magnetic patterns of rocks (PALAEOMAGNETISM) which can be used to date the age of tectonic crust

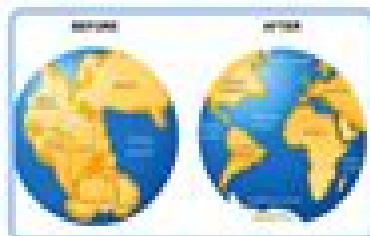

CONVECTION CURRENTS

- Radioactive decay within the core releases heat which rises through the mantle and drives convection currents
- Convection currents act as cells which move tectonic plates
- tectonic plates are able to move as the lithosphere is able to 'float' above the asthenosphere

CONTINENTAL DRIFT

- Alfred Wegener proposed that all of the continents were originally connected together by the super continent Pangaea
- The evidence that supports this theory:
 - Jigsaw fit of South America and Africa
 - Fossils
 - Glacial deposits
 - Rock type

Politics, and Partisan Polarization in the United States, 1828-2016 David Darmofal,Ryan Strickler,2019-01-21 This book examines the geography of partisan polarization or the Reds and Blues of the political landscape in the United States It places the current schism between Democrats and Republicans within a historical context and presents a theoretical framework that offers unique insights into the American electorate The authors focus on the demographic and political causes of polarization at the local level across space and time This is accomplished with the aid of a comprehensive dataset that includes the presidential election results for every county in the continental United States from the advent of Jacksonian democracy in 1828 to the 2016 election In addition coverage applies spatial diagnostics spatial lag models and spatial error models to determine why contemporary and historical elections in the United States have exhibited their familiar but heretofore unexplained political geography Both popular observers and scholars alike have expressed concern that citizens are becoming increasingly polarized and as a consequence that democratic governance is beginning to break down This book argues that once current levels of polarization are placed within a historical context the future does not look quite so bleak Overall readers will discover that partisan division is a dynamic process in large part due to the complex interplay between changing demographics and changing politics **Cambridge International AS and A Level Geography second edition**
