Geometric Transformations I:

Geometric Transformations Răzvan Gelca, Ionuț Onișor, Carlos Yuzo Shine, 2022-02-16 This textbook teaches the transformations of plane Euclidean geometry through problems offering a transformation based perspective on problems that have appeared in recent years at mathematics competitions around the globe as well as on some classical examples and theorems. It is based on the combined teaching experience of the authors, coaches of several Mathematical Olympiad teams in Brazil, Romania, and the USA, and presents comprehensive theoretical discussions of isometries, homotheties, and spiral similarities and inversions, all illustrated by examples and followed by myriad problems left for the reader to solve. These problems were carefully selected and arranged to introduce students to the topics by gradually moving from basic to expert level. Most of them have appeared in competitions such as Mathematical Olympiads or in mathematical journals aimed at an audience interested in mathematics competitions, while some are fundamental facts of mathematics discussed in the framework of geometric transformations. The book offers a global view of the geometric content of today's mathematics competitions, bringing many new methods and ideas to the attention of the public. Talented high school and middle school students seeking to improve their problem-solving skills can benefit from this book, as well as high school and college instructors who want to add nonstandard questions to their courses. People who enjoy solving elementary math problems as a hobby will also enjoy this work.

Geometric Transformations I-III Isaak Moiseevich IĭAĭglom, 1962

Geometric Transformations IV I. M. Yaglom, 2009-10-15 The familiar plane geometry of high school figures composed of lines and circles takes on a new life when viewed as the study of properties that are preserved by special groups of transformations. No longer is there a single universal geometry; different sets of transformations of the plane correspond to intriguing disparate geometries. This book is the concluding Part IV of Geometric Transformations, but it can be studied independently of Parts I, II, and III, which appeared in this series as Volumes 8, 21, and 24. Part I treats the geometry of rigid motions of the plane, isometries. Part II treats the geometry of shape-preserving transformations of the plane, similarities. Part III treats the geometry of transformations of the plane that map lines to lines, affine and projective transformations, and introduces the Klein model of non-Euclidean geometry. The present Part IV develops the geometry of transformations of the plane that map circles to circles, conformal or anallagmatic geometry. The notion of inversion or reflection in a circle is the key tool employed. Applications include ruler and compass constructions and the Poincaré model of hyperbolic geometry. The straightforward direct presentation assumes only some background in high school geometry and trigonometry. Numerous exercises lead the reader to a mastery of the methods and concepts. The second half of the book contains detailed solutions of all the problems.

Euclidean and Affine Transformations P. S. Modenov,A. S. Parkhomenko,2014-05-12 *Geometric Transformations Volume 1* Euclidean and Affine Transformations focuses on the study of coordinates trigonometry transformations and linear equations The publication first takes a look at orthogonal transformations including orthogonal transformations of the first and second kinds representations of orthogonal transformations as the products of fundamental orthogonal transformations and representation of an orthogonal transformation of space as a product of fundamental orthogonal transformations The text then examines similarity and affine transformations Topics include properties of affine mappings Darboux s lemma and its consequences affine transformations in coordinates homothetic transformations similarity transformations of the plane in coordinates and similarity mapping The book takes a look at the representation of a similarity transformation as the product of a homothetic transformation and an orthogonal transformation application of affine transformations to the investigation of properties of the ellipse and representation of any affine transformation as a product of affine transformations of the simplest types The manuscript is a valuable reference for high school teachers and readers interested in the Euclidean and affine transformations **Geometric Transformations** Petr Sergeevich Modenov,A.
