

Infrared Spectroscopy

1. Introduction

As noted in a previous chapter, the light our eyes see is but a small part of a broad spectrum of electromagnetic radiation. On the immediate high energy side of the visible spectrum lies the ultraviolet, and on the low energy side is the infrared. The portion of the infrared region most useful for analysis of organic compounds is not immediately adjacent to the visible spectrum, but is that having a wavelength range from 2,500 to 16,000 nm, with a corresponding frequency range from 1.9×10^{13} to 1.2×10^{14} Hz.

Photon energies associated with this part of the infrared (from 1 to 15 kcal/mole) are not large enough to excite electrons, but may induce vibrational excitation of covalently bonded atoms and groups. The covalent bonds in molecules are not rigid sticks or rods, such as found in molecular model kits, but are more like stiff springs that can be stretched and bent. The mobile nature of organic molecules was noted in the chapter concerning [conformational isomers](#). We must now recognize that, in addition to the facile rotation of groups about single bonds, molecules experience a wide variety of vibrational motions, characteristic of their component atoms. Consequently, virtually all organic compounds will absorb infrared radiation that corresponds in energy to these vibrations. Infrared spectrometers, similar in principle to the UV-Visible spectrometer [described elsewhere](#), permit chemists to obtain absorption spectra of compounds that are a unique reflection of their molecular structure. An example of such a spectrum is that of the flavoring agent vanillin, shown below.

The complexity of this spectrum is typical of most infrared spectra, and illustrates their use in identifying substances. The gap in the spectrum between 700 & 800 cm^{-1} is due to solvent (CCl_4) absorption. Further analysis (below) will show that this spectrum also indicates the presence of an aldehyde function, a phenolic hydroxyl and a substituted benzene ring. The inverted display of absorption, compared with [UV-Visible spectra](#), is characteristic. Thus a sample that did not absorb at all would record a horizontal line at 100% transmittance (top of the chart).

Infrared Characterization for Microelectronics W. S. Lau, 1999 Most of the books on infrared characterization are for applications in chemistry and no book has been dedicated to infrared characterization for microelectronics The focus of the book will be on practical applications useful to the production line and to the research and development of microelectronics The background knowledge and significance of doing a particular type of infrared measurement will be discussed in detail The principal purpose of the book is to serve as a useful handbook for practising engineers and scientists in the field of microelectronics The Chlorophylls Leo P. Vernon, Gilbert R. Seely, 2014-06-28 The Chlorophylls reviews developments in study of chlorophylls and at the same time summarizes the state of knowledge in the more established areas of the physics chemistry and biology of chlorophylls The book is organized into four sections The first section deals with the chlorophylls as chemical entities and treats their isolation analysis chemistry and synthesis The second concerns chlorophylls in real and colloidal solution and in the solid state in vitro and includes the effects of aggregation on visible infrared and NMR spectral properties The third section treats the biosynthesis organization and properties of chlorophylls in the plant and bacterial cell and the fourth is concerned with the photochemical and photophysical behavior of chlorophylls in vitro and in vivo It is hoped that this work will help those investigating selected aspects of chlorophyll to keep abreast of other methods and approaches and will provide the interested scientist with a modern conceptually organized treatment of the subject **U.S.**

Environmental Protection Agency. Library Systems Branch, 1974 **Interpretation of Organic Spectra** Yong-Cheng Ning, 2011-04-18 Although there are a number of books in this field most of them lack an introduction of comprehensive analysis of MS and IR spectra and others do not provide up to date information like tandem MS This book fills the gap The merit of this book is that the author will not only introduce knowledge for analyzing nuclear magnetic resonance spectra including ^1H spectra Chapter 1 ^{13}C spectra Chapter 2 and 2D NMR spectra Chapter 3 he also arms readers systemically with knowledge of Mass spectra including EI MS spectra and MS spectra by using soft ionizations Chapter 4 and IR spectra Chapter 5 In each chapter the author presents very practical application skills by providing various challenging examples The last chapter Chapter 6 provides the strategy skills and methods on how to identify an unknown compound through a combination of spectra Based on nearly 40 years researching and teaching experience the author also proposes some original

and creative ideas which are very practical for spectral interpretation

Chain Structure and Conformation of

Macromolecules Frank Bovey, 2012-12-02 Chain Structure and Conformation of Macromolecules provides an introduction to the chain structures of synthetic polymers and their determination in solution and in the solid state This book discusses the synthetic methods and polymerization mechanisms Organized into eight chapters this book begins with an overview of the brief history of the macromolecular concept and of stereochemical and geometrical isomerism in synthetic polymer chains This text then introduces vibrational spectroscopy and nuclear magnetic resonance spectroscopy Other chapters consider the geometric isomerism in diene copolymers as well as the rotational isomeric state method of calculation of polymer chain dimensions This book discusses as well copolymerization and the measurement of copolymer structure The final chapter deals with the NMR observation of polymers in the solid state by the method of magic angle spinning by which both dynamic measurements and high resolution structural information are possible This book is a valuable resource for organic chemists chemical engineers and research workers

Gas-Phase IR Spectroscopy and Structure of Biological Molecules Anouk M. Rijs, Jos Oomens, 2015-06-03 The series Topics in Current Chemistry presents critical reviews of the present and future trends in modern chemical research The scope of coverage is all areas of chemical science including the interfaces with related disciplines such as biology, medicine and materials science The goal of each thematic volume is to give the non specialist reader, whether in academia or industry, a comprehensive insight into an area where new research is emerging which is of interest to a larger scientific audience Each review within the volume critically surveys one aspect of that topic and places it within the context of the volume as a whole The most significant developments of the last 5 to 10 years are presented using selected examples to illustrate the principles discussed The coverage is not intended to be an exhaustive summary of the field or include large quantities of data but should rather be conceptual, concentrating on the methodological thinking that will allow the non specialist reader to understand the information presented Contributions also offer an outlook on potential future developments in the field Review articles for the individual volumes are invited by the volume editors Readership: research chemists at universities or in industry, graduate students
