

Chapter 5. Elliptic modular forms and their L -functions

A modular form of weight k with respect to $SL_2(\mathbb{Z})$ is a holomorphic function on the upper half complex plane

$$\mathcal{H} = \{z \in \mathbb{C} \mid \operatorname{Im}(z) > 0\}$$

satisfying the functional equation

$$f\left(\frac{az+b}{cz+d}\right) = f(z)(cz+d)^k \quad \text{for all} \quad \begin{pmatrix} a & b \\ c & d \end{pmatrix} \in SL_2(\mathbb{Z}).$$

Thus it is invariant under the translation $z \mapsto z+1$ and has Fourier expansion:

$$f(z) = \sum_{n=-\infty}^{\infty} a_n e(nz) \quad \text{for} \quad e(z) = \exp(2\pi\sqrt{-1}z).$$

We always assume that $a_n = 0$ if $n < 0$. A typical example of such a modular form is given by absolutely convergent Eisenstein series

$$E'_k(z) = \sum'_{(m,n)} (mz+n)^{-k} \quad \text{for every even integer } k > 2,$$

where $\sum'$ means that the summation is taken over all ordered pairs of integers (m,n) but $(0,0)$. The Fourier expansion of $E'_k(z)$ is well known (we will verify the expansion later):

$$E_k(z) = \left(\frac{2(2\pi\sqrt{-1})^k}{(k-1)!}\right)^{-1} E'_k(z) = 2^{-1}\zeta(1-k) + \sum_{n=1}^{\infty} \sigma_{k-1}(n)q^n,$$

where $\sigma_m(n) = \sum_{0 < d \mid n} d^m$ is the sum of m -th powers of divisors of n . In this section, we study the complex analytic theory of modular forms. To each holomorphic modular form $f = \sum_{n=0}^{\infty} a_n q^n$, we associate a Dirichlet series

$$L(s, f) = \sum_{n=1}^{\infty} a_n n^{-s},$$

and with each pair of modular forms f and $g = \sum_{n=0}^{\infty} b_n q^n$, we also associate another Dirichlet series

$$D(s, f, g) = \sum_{n=1}^{\infty} \bar{a}_n b_n n^{-s}.$$

Then, we will study algebraicity properties of these modular L -functions later in this chapter and Chapters 6 and 10.

§5.1. Classical Eisenstein series of $GL(2)_{/\mathbb{Q}}$

A subgroup of $SL_2(\mathbb{Z})$ is called a congruence subgroup if it contains all matrices $\alpha = \begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix} \pmod{N}$ in $SL_2(\mathbb{Z})$ for an integer $N > 0$. We study here Eisenstein series for congruence subgroups of $SL_2(\mathbb{Z})$. In this book, we are mainly concerned with modular forms with respect to the following type of congruence subgroups: for each positive integer N

$$\Gamma_0(N) = \left\{ \begin{pmatrix} a & b \\ c & d \end{pmatrix} \in SL_2(\mathbb{Z}) \mid c \in N\mathbb{Z} \right\}.$$

Elementary Theory Of L Functions And Eisenstein Series:

Elementary Theory of L-functions and Eisenstein Series Haruzo Hida, 1993-02-11 The theory of p adic and classic modular forms and the study of arithmetic and p adic L functions has proved to be a fruitful area of mathematics over the last decade Professor Hida has given courses on these topics in the USA Japan and in France and in this book provides the reader with an elementary but detailed insight into the theory of L functions The presentation is self contained and concise and the subject is approached using only basic tools from complex analysis and cohomology theory Graduate students wishing to know more about L functions will find that this book offers a unique introduction to this fascinating branch of mathematics

Elementary Theory of L-functions and Eisenstein Series Haruzo Hida, 1993-02-11 This book is a comprehensive and systematic account of the theory of p adic and classical modular forms and the theory of the special values of arithmetic L functions and p adic L functions The approach is basically algebraic and the treatment is elementary No deep knowledge from algebraic geometry and representation theory is required The author's main tool in dealing with these problems is taken from cohomology theory over Riemann surfaces which is also explained in detail in the book He also gives a concise but thorough treatment of analytic continuation and functional equation Graduate students wishing to know more about L functions will find this a unique introduction to this fascinating branch of mathematics

Iwasawa Theory 2012 Thanasis Bouganis, Otmar Venjakob, 2014-12-08 This is the fifth conference in a bi annual series following conferences in Besancon Limoges Irsee and Toronto The meeting aims to bring together different strands of research in and closely related to the area of Iwasawa theory During the week before the conference in a kind of summer school a series of preparatory lectures for young mathematicians was provided as an introduction to Iwasawa theory Iwasawa theory is a modern and powerful branch of number theory and can be traced back to the Japanese mathematician Kenkichi Iwasawa who introduced the systematic study of $\mathbb{Z}_p$ extensions and p adic L functions concentrating on the case of ideal class groups Later this would be generalized to elliptic curves Over the last few decades considerable progress has been made in automorphic Iwasawa theory e g the proof of the Main Conjecture for GL_2 by Kato and Skinner Urban Techniques such as Hida's theory of p adic modular forms and big Galois representations play a crucial part Also a noncommutative Iwasawa theory of arbitrary p adic Lie extensions has been developed This volume aims to present a snapshot of the state of art of Iwasawa theory as of 2012 In particular it offers an introduction to Iwasawa theory based on a preparatory course by Chris Wuthrich and a survey of the proof of Skinner Urban based on a lecture course by Xin Wan

Number Theory Wenpeng Zhang, Yoshio Tanigawa, 2006-06-05 Number Theory Tradition and Modernization is a collection of survey and research papers on various topics in number theory Though the topics and descriptive details appear varied they are unified by two underlying principles first making everything readable as a book and second making a smooth transition from traditional approaches to modern ones by providing a rich array of examples The chapters are presented in quite different in depth and cover a variety of

descriptive details but the underlying editorial principle enables the reader to have a unified glimpse of the developments of number theory. Thus on the one hand the traditional approach is presented in great detail and on the other the modernization of the methods in number theory is elaborated. The book emphasizes a few common features such as functional equations for various zeta functions, modular forms, congruence conditions, exponential sums and algorithmic aspects.

Fourier Analysis on Number Fields Dinakar Ramakrishnan, Robert J. Valenza, 2013-04-17 This book grew out of notes from several courses that the first author has taught over the past nine years at the California Institute of Technology and earlier at the Johns Hopkins University, Cornell University, the University of Chicago and the University of Crete. Our general aim is to provide a modern approach to number theory through a blending of complementary algebraic and analytic perspectives, emphasizing harmonic analysis on topological groups. Our more particular goal is to cover Jörm Tate's visionary thesis, giving virtually all of the necessary analytic details and topological preliminaries, technical prerequisites that are often foreign to the typical more algebraically inclined number theorist. Most of the existing treatments of Tate's thesis, including Tate's own, range from terse to cryptic; our intent is to be more leisurely, more comprehensive and more comprehensible. To this end we have assembled material that has admittedly been treated elsewhere but not in a single volume with so much detail and not with our particular focus. We address our text to students who have taken a year of graduate level courses in algebra, analysis and topology. While our choice of objects and methods is naturally guided by the specific mathematical goals of the text, our approach is by no means narrow. In fact the subject matter at hand is germane not only to budding number theorists but also to students of harmonic analysis or the representation theory of Lie groups.

Advanced Analytic Number Theory: L-Functions Carlos J. Moreno, 2005 Since the pioneering work of Euler, Dirichlet and Riemann, the analytic properties of L-functions have been used to study the distribution of prime numbers. With the advent of the Langlands Program, L-functions have assumed a greater role in the study of the interplay between Diophantine questions about primes and representation theoretic properties of Galois representations. This book provides a complete introduction to the most significant class of L-functions: the Artin-Hecke L-functions associated to finite dimensional representations of Weil groups and to automorphic L-functions of principal type on the general linear group. In addition to establishing functional equations, growth estimates and non-vanishing theorems, a thorough presentation of the explicit formulas of Riemann type in the context of Artin-Hecke and automorphic L-functions is also given. The survey is aimed at mathematicians and graduate students who want to learn about the modern analytic theory of L-functions and their applications in number theory and in the theory of automorphic representations. The requirements for a profitable study of this monograph are a knowledge of basic number theory and the rudiments of abstract harmonic analysis on locally compact abelian groups.

Number Theory Alina Bucur, Wei Ho, Renate Scheidler, 2024-06-26 This is the fifth proceedings volume published under the Women in Numbers umbrella. The WIN workshops and their proceedings volumes are part of the WIN network aimed at highlighting the research of women and gender minorities in number theory as well as increasing their participation and boosting their potential collaborations in number theory and related fields. The volume contains research articles in the mathematical area of number theory written by teams of scholars at all levels in the field. More information about the network, its goals and purpose, past and future conferences and past proceedings volumes can be found on the WIN website. This volume contains research outcomes and results produced by the collaborative research groups created under the Women in Numbers V workshop, the 5th in its series. The actual workshop was to take place in 2020 at the Banff International Research Station in Banff, Canada, but could not take place onsite due to COVID. The associated research groups, each consisting of 1-2 leaders and 2-4 junior researchers, were formed nevertheless and their collaborations went ahead in purely virtual form as well as other papers by author teams for which at least 50% of the authors identify as women or gender minorities. These contributions include original research and survey articles in a wide variety of subareas within number theory. The former present new cutting edge research that will be of interest to experts in the field to the benefit of their own research. The survey articles serve as an accessible introduction for graduate students and other readers to areas of number theory that may be outside their area of expertise. ***p -adic Aspects Of Modular Forms*** Baskar Balasubramanyam, A
