Write mode

We address the PCF8570 by the usual Start Condition and Slave Address. After the component acknowledges us, we indicate the address at which the first data will be written. This step is essential! Thanks to an auto-increment feature (similar to the SAA1064 LED driver detailed earlier), which automatically increments to the next address, it is possible to input several data which is stored in successively increasing RAM locations, until the exchange is terminated by a Stop condition. When the highest possible address is arrived at, the circuit loops back and starts again from address zero.

## Read Mode

There are two variations of a read operation.

Figure 9.13

Variant 1

The master reads the memory after presenting the read start address. This component is first addressed in write mode so as to indicate to the device from which address we want to begin reading. Without stopping (no STOP condition), a RESTART is generated (a new START condition), followed by the address of this same component, this time in read mode. The component now knows where reading should begin because the address has been loaded into the auto-increment register. From this point
