Characteristic clinical immune phenotypes and molecular mechanisms associated with inflammatory diseases, 2nd edition Chengjin Gao, Shuming Pan, Kun Xiong, 2024-11-06 The systemic inflammatory response is evident in inflammatory diseases and the immune system secretes many cytokines involved resulting in a robust immune response For example the pathogenesis of sepsis includes abnormal immune cell activation in the early stages as well as sepsis related immunosuppression During the immunosuppressive phase CD4 T cells CD8 T cells Th17 cells and d T cells are reduced while regulatory T cells increase At the same time T lymphocytes and neutrophils as immune effector cells interact with each other and play a key role in regulating the immune response to immune inflammatory diseases The increased release of neutrophil extracellular trap networks NETs by neutrophils leads to a significant upregulation of NETs DNA MPO which further aggravates the septic inflammatory response and organ functional impairment Therefore it is important to deeply investigate the characteristic clinical immune phenotypes and molecular mechanisms associated with inflammatory diseases and targeting therapies against them may provide new ideas for the precise treatment of diseases The goal of this Research Topic is to provide a forum to advance research on the contribution of the fundamental mechanisms of immune system development and function with special emphasis on the description and mechanism of clinical immunological phenotypes in different immune disorders and the definition of their molecular basis The Research Topic had the bullet points including but not limited to the following 1 Description of the immune phenotypes of various common acute and chronic diseases 2 The regulatory mechanisms of different factors on the development and function of the host immune system 3 Inflammatory immunological mechanisms organ function and interorgan interactions

Ganguly,2024-04-09 Dendritic cells DCs play a critical role in immune system as they are necessary both for innate and adaptive immunity According to their function dendritic cells can be classified in immune tolerogenic or inflammatory DCs DCs have been shown to regulate T cell mediated immune responses and lead to immune tolerance and autoimmunity For example immune tolerogenic DCs facilitate the development of regulatory T cells and inhibit T helper 17 mediated autoimmunity in mice with experimental autoimmune encephalomyelitis Moreover inflammatory DCs activate CD8 and CD4 T cells and elicit T cell mediated inflammatory immune responses in vivo However the molecular and cellular mechanisms underlying DC mediated immune tolerance and autoimmunity are still obscure Allergy Allen P.
