Sets, Logic and Maths for Computing David Makinson, 2009-06-29

The first part of this preface is for the student the second for the instructor But whoever you are welcome to both parts For the Student You have finished secondary school and are about to begin at a university or technical college You want to study computing The course includes some mathematics and that was not necessarily your favourite subject But there is no escape some finite mathematics is a required part of the first year curriculum That is where this book comes in Its purpose is to provide the basics the essentials that you need to know to understand the mathematical language that is used in computer and information science It does not contain all the mathematics that you will need to look at through the several years of your undergraduate career There are other very good massive volumes that do that At some stage you will probably find it useful to get one and keep it on your shelf for reference But experience has convinced this author that no matter how good the compendia are beginning students tend to feel intimidated lost and unclear about what parts to focus on This short book on the other hand offers just the basics which you need to know from the beginning and on which you can build further when needed

Foundations of Computer Science S. I. Adin, 1997-05-28 A Sobolev gradient of a real valued functional is a gradient of that functional taken relative to the underlying Sobolev norm This book shows how descent methods using such gradients allow a unified treatment of a wide variety of problems in differential equations Equal emphasis is placed on numerical and theoretical matters Several concrete applications are made to illustrate the method These applications include 1 Ginzburg Landau functionals of superconductivity 2 problems of transonic flow in which type depends locally on nonlinearities and 3 minimal surface problems Sobolev gradient constructions rely on a study of orthogonal projections onto graphs of closed densely defined linear transformations from one Hilbert space to another These developments use work of Weyl von Neumann and Beurling
