Interventions In The Acute Phase Of Myocardial Infarction:

Interventions in the Acute Phase of Myocardial Infarction J. Morganroth, E. Neil Moore, 2012-12-06 In the 1980s a primary focus for intense cardiovascular research is in the treatment of patients with acute myocardial infarction. Although the prevalence of this syndrome has been decreasing in the United States, still over 1.5 million patients develop myocardial infarction per year. There is about a 20% chance of a North American male developing myocardial infarction before the age of 65. The in-hospital mortality still remains at approximately 100/70-150/70, and advances in pharmacologic and device therapy have allowed for the intensification of research in the treatment of patients with acute myocardial infarction. The following manuscripts represent the collective efforts of academic investigators in the United States and abroad as well as members of the pharmaceutical industry and the Food and Drug Administration to address the issues involved in interventions in the acute phase of myocardial infarction. State-of-the-art papers addressing important topics are followed by discussion sections which have allowed participants to express their own viewpoints leading to a consensus opinion. The first part of this Symposium addresses the models of experimental myocardial infarction followed by the important issue of how one defines myocardial infarction size. The latter is extremely important to be certain that endpoints of therapeutic or device interventions are objective and reproducible. A detailed description of the pharmacological interventions to reduce myocardial infarction size as well as newer devices to effect mechanical and electrical disorders provide an up-to-date summary of current opinion.

Clinical Cardiology: Current Practice Guidelines Demosthenes G. Katritsis, Bernard J. Gersh, A. John Camm, 2016-09-15 *Clinical Cardiology: Current Practice Guidelines* Updated Edition is an essential tool for the busy clinician offering succinct yet detailed access to the most recent trial and guideline data supporting practice and patient management in cardiology. ESC and ACC/AHA guidelines are continually updated and often overlap in their advice making it difficult for the cardiologist to obtain a clear picture of the right way to diagnose and treat disease according to the latest evidence base. Written by leading authorities in the field, this book together with its regularly updated online version provides a unique solution. The authors have scrutinized all available guidelines and research from both ACC/AHA and ESC on every clinical issue. The result is a rigorous examination of the implications of published guidance illustrated by more than 600 easy-to-follow tables and 200 full-colour images which reinforce key points and clarify difficult concepts. 87 comprehensive chapters explore the definition, epidemiology, pathophysiology, diagnosis, and management of cardiac disease. Two new chapters examine the univentricular heart and venous thromboembolism. Each chapter encompasses the latest published research followed by discussions of possible presentations and investigations offering detailed insights for clinicians into best practice for diagnosis and treatment. Providing at a glance access to the best guidance in cardiology, this book offers a diagnosis and management toolkit which no practising cardiologist can afford to be without.
