Execution Models Of Prolog For Parallel Computers:

   Execution Models of Prolog for Parallel Computers Péter Kacsuk,1990 The research described in this book addresses the semantic gap between logic programming languages and the architecture of parallel computers the problem of how to implement logic programming languages on parallel computers in a way that can most effectively exploit the inherent parallelism of the language and efficiently utilize the parallel architecture of the computer Following a useful review of other research results the first project explores the possibilities of implementing logic programs on MIMD nonshared memory massively parallel computers containing 100 to 1 000 processing elements The second investigates the possibility of implementing Prolog on a typical SIMD machine called a Distributed Processor Array The author s objectives are to define a parallel computational paradigm the Extended Cellular Dataflow Model that can be used to create a Parallel Prolog Abstract Machine as a general starting point for implementing logic programming languages on parallel computers to exploit the different types of parallelism of these programs to define an efficient parallel logic machine to explore the possibilities of implementing logic programming languages on array processors such as the DAP to invent parallel implementation techniques for effectively executing Prolog on the DAP and to define a parallel extension of Prolog that is able to utilize the processor aggregate of the DAP for effectively solving numerical subproblems within logic programs Peter Kacsuk is with Multilogic Computing Ltd of Budapest Hungary   *Execution Models of Prolog for Parallel Computers* Peter Kacsukm,1990-02-01   **Execution Models of Prolog for Parallel Computers** KACSUK PÉTER.,1988   <u>Future Parallel Computers</u> Philip C. Correa,Ines de Castro Dutra,Mario Fiallos,Luiz Fernando Gomes da Silva,2013-06-29 Parallel and distributed computation has been gaining a great lot of attention in the last decades During this period the advances attained in computing and communication technologies and the reduction in the costs of those technolo gies played a central role in the rapid growth of the interest in the use of parallel and distributed computation in a number of areas of engineering and sciences Many actual applications have been successfully implemented in various plat forms varying from pure shared memory to totally distributed models passing through hybrid approaches such as distributed shared memory architectures Parallel and distributed computation differs from dassical sequential compu tation in some of the following major aspects the number of processing units

independent local dock for each unit the number of memory units and the programming model For representing this diversity and depending on what level we are looking at the problem researchers have proposed some models to abstract the main characteristics or parameters physical components or logical mechanisms of parallel computers The problem of establishing a suitable model is to find a reasonable trade off among simplicity power of expression and universality Then be able to study and analyze more precisely the behavior of parallel applications **Artificial Intelligence and Information-control Systems of Robots '94** International Conference on Artificial Intelligence and Information-Control Systems of Robots 1994, Smolenice (Slovakia),1994 **Parallel Computing and Transputer Applications** Mateo Valero,1992 Mathematics of Computing Parallelism **Parallel Computation and Computers for Artificial Intelligence** J.S. Beer,1989-12-13 This monograph presents a novel execution model for the parallel execution of standard sequential Prolog In this execution model Prolog procedure calls can be efficiently pipelined and the author shows how even fully deterministic Prolog programs can be effectively mapped onto the proposed architecture The design is based on a highly optimized abstract Prolog specific instruction set A special feature of this work is a sophisticated classification scheme for Prolog variables which substantially reduces the overhead for unification with occur check To support the model an architecture consisting of a circular pipeline of independent processors has been designed This pipeline has been designed to work as a co processor to a UNIX based workstation In contrast to other attempts to execute sequential Prolog in parallel the proposed model does not restrict the use of any of the standard Prolog language features The book gives a full account of the execution model the system architecture and the abstract Prolog instruction set   **Advances in Computing and Information - ICCI '90** Selim G.
