Facts And Models In Hearing:

Facts and Models in Hearing Eberhard Zwicker, E. Terhardt, 1974 **Facts and Models in Hearing** E. Zwicker, E. Terhardt, 1974-08-06 **Psychoacoustics** Eberhard Zwicker, Hugo Fastl, 2013-03-14 Psychoacoustics Facts and Models represents a comprehensive collection of data describing the processing of sound by the human hearing system. It includes quantitative relations between sound stimuli and auditory perception in terms of hearing sensations. In addition, quantitative psychoacoustic models of hearing sensations are given. The monograph contains a unique collection of data on the human hearing system as a receiver of acoustic information as well as many examples of the practical application of the results of basic research in fields such as audiology, noise evaluation, and sound engineering. Many helpful hints for the solution of practical problems will be of particular benefit to engineers, and the book as a whole should serve as an important benchmark in the field of psychoacoustics. The treatment given in this second edition has been thoroughly updated with recent results.

Facts and Models in Hearing E. Zwicker, E. Terhardt, 2013-03-12 During recent years, auditory research has advanced quite rapidly in the area of experimental psychology as well as in that of physiology. Scientists working in both areas have in common the study of the process in HEARING, yet different scientific areas always tend to diverge. A SYMPOSIUM ON PSYCHOPHYSICAL MODELS AND PHYSIOLOGICAL FACTS IN HEARING was organized for the exchange of information and to stimulate discussion between research workers in psychoacoustics, neurophysiology, anatomy, morphology, and hydromechanics. The basic aim of holding this symposium was to halt the divergence and to initiate the kind of multidisciplinary research that will be needed to elucidate the hearing process as a whole. The present proceedings comprise the papers which were circulated to the participants two months before the symposium and discussed during the symposium together with some comments and additional remarks. These comments and remarks do not, however, represent the full discussions but only the parts available in written form. We have arranged the material in five sections: I. Structure and Neurobiology of the Inner Ear; II. Cochlear Mechanisms; III. Auditory Frequency Analysis; IV. Auditory Time Analysis; V. Nonlinear Effects. Within the limits of a symposium, none of these topics could be treated comprehensively; moreover, most of the papers concerned problems having several aspects. **FACTS AND MODELS IN HEARING- PROCEEDINGS OF THE SYMPOSIUM ON PSYCHOPHYSICAL MODELS AND PHYSIOLOGICAL FACTS IN HEARING.** ,

The Cognitive Representation of Speech T. Myers, J. Laver, J. Anderson, 1981-12-01 The 32 main papers taken together provide a comprehensive review of speech research by scientists who have made leading contributions to our understanding of the topics discussed. The papers are assembled within a coherent problem-oriented structure. **Facts and Models in Hearing** E. Zwicker, E. Multisensory and sensorimotor interactions in speech perception Kaisa Tiippana, Jean-Luc Schwartz, Riikka Möttönen, 2015-06-26 Speech is multisensory since it is perceived through several senses Audition is the most important one as speech is mostly heard The role of vision has long been acknowledged since many articulatory gestures can be seen on the talker s face Sometimes speech can even be felt by touching the face The best known multisensory illusion is the McGurk effect where incongruent visual articulation changes the auditory percept The interest in the McGurk effect arises from a major general question in multisensory research How is information from different senses combined Despite decades of research a conclusive explanation for the illusion remains elusive This is a good demonstration of the challenges in the study of multisensory integration Speech is special in many ways It is the main means of human communication and a manifestation of a unique language system It is a signal with which all humans have a lot of experience We are exposed to it from birth and learn it through development in face to face contact with others It is a signal that we can both perceive and produce The role of the motor system in speech perception has been debated for a long time Despite very active current research it is still unclear to which extent and in which role the motor system is involved in speech perception Recent evidence shows that brain areas involved in speech production are activated during listening to speech and watching a talker s articulatory gestures Speaking involves coordination of articulatory

movements and monitoring their auditory and somatosensory consequences How do auditory visual somatosensory and motor brain areas interact during speech perception How do these sensorimotor interactions contribute to speech perception It is surprising that despite a vast amount of research the secrets of speech perception have not yet been solved The multisensory and sensorimotor approaches provide new opportunities in solving them Contributions to the research topic are encouraged for a wide spectrum of research on speech perception in multisensory and sensorimotor contexts including novel experimental findings ranging from psychophysics to brain imaging theories and models reviews and opinions
