Energy Conversion Systems Flow Physics And Engineering:

Energy Conversion Reiner Decher, 1994 As conventional energy sources such as fossil fuels become increasingly scarce scientists and engineers will need to rely more and more on new sources such as geothermal solar ocean thermal magnetohydrodynamic nuclear and hydrogen energy to meet the world's energy demands The utilization of all these forms of energy involves the conversion of heat to mechanical energy Designed for senior level undergraduates Energy Conversion develops an understanding of the physical processes involved in the transformation of one form of energy to another The emphasis is on a description of models of the elementary processes to allow assessment of performance potential and to allow a determination of the sensitivity to design choices Since many energy conversion processes involve the manipulation of gaseous substances there is heavy emphasis on the description of fluids and gases in particular Energy conversion processes involve heat and work interactions between a system and its environment as well as state and property decisions In order to arrive at simple understandable relations simplifications are made which allow description at the expense of some numerical accuracy More accurate descriptions can be made with more sophisticated computational tools and nearly all numerical calculations presented are made with the equations developed so that the student can implement them on a computer and reproduce them with his or her own choice of parameters In most chapters problems are presented which are designed to aid the student in the practical applications of the underlying principles of energy conversion to the performance of real engines Energy Conversion offers extensive coverage of basic principles applied thermodynamics the economics of power plants turbomachinery and lucid discussion of the environmental impact of energy conversion

Alternative Energy Systems M. Godoy Simões, Felix A. Farret, 2007-12-10 New perspectives on using induction generators in alternative energy technologies Durable and cost effective induction power generators have undergone numerous improvements that make them an increasingly attractive option for renewable energy applications particularly for wind and hydropower generation systems From fundamental concepts to the latest technologies Alternative Energy Systems Design and Analysis with Induction Generators Second Edition provides detailed and accurate coverage of all aspects related to the design operation and overall analysis of such systems Placing a greater emphasis on providing clear precise and succinct explanations this second edition features new revised and updated content as well as figures tables equations and examples Each chapter introduces a multi step chapter length problem relating the material to a real application The solution appears at the end of the chapter along with additional practice problems and references New Material in This Edition Updated definitions for generated power and efficiency Technological advances such as new applications using doubly fed induction generators New methodologies such as the magnetization curve representation for induction generators Additional focus on renewable energy applications such as sea wind and hydropower systems Totally re written and updated chapter covering doubly fed induction generators Alternative Energy Systems provides the tools and expertise for advanced students and professionals in
