Hammerling, A.B. Budgor, A. Pinto, 2013-04-17 In recent years there has been renewed interest in the scientific and industrial communities in tunable solid state vibronic

lasers Much of this has been spurred by the user desirous of obtaining compact primary laser sources independent of nonlinear optical frequency shifts throughout the visible and near infra red spectral regions To further motivate and stimulate research and development in this area workshops sponsored by the Laser Division of the US Army Night Vision Electro Optics Laboratory NVEOL at Fort Belvoir Virginia were held during 13 April 1981 and 16-17 June 1983 at Keystone and NVEOL respectively The consensus of opinion of the participants at these workshops was that any successful program leading to the identification and development of vibronic tunable laser materials in the visible and IR must include coordinated activity between crystal growers theoretical and experimental investigators into the fundamental processes of vibronic lasing and laser device engineers Continued interaction between government industry and academia was encouraged in order to establish a unified approach to these areas and when necessary redefine and redirect programmatic activity The organization of this 1st Annual Conference on Tunable Solid State Lasers held at the La Jolla Institute 13-15 June 1984 was based around the latest results in tunable vibronic materials and laser development but structured in a manner consistent with the recommendations of the NVEOL workshops

Holography and Deformation Analysis W. Schumann, J.-P. Zürcher, D. Cuche, 2013-04-17 In this book series on Optical Sciences holography has been the subject of three previous volumes In particular Vol 16 written by one of us W S and Dr M Dubas treated holographic interferometry of opaque bodies from the standpoint of deformation analysis However the fundamental principles of holography are developed there only briefly in preparation for a discussion of interference fringe modifications This new volume in the series is intended to consider in detail many topics which were previously omitted such as the deformation or distortion of holographic images the theory of volume holograms composite or multiplex holography holographic interferometry of transparent media time dependent effects holographic contouring and applications of fringe modifications to the deformation of opaque bodies In addition these and other subjects will be treated with the same unifying concept developed in Vol 16 but with an additional emphasis on those features that have their origins in classical optics especially the small wavelength approach the coupled wave theory and the Seidel aberrations Since the field of holography and its various applications is growing rapidly it is impossible to be comprehensive in a single book Every effort has been made to avoid unnecessary duplication of Vol 16 For example displacement and fringe localization problems are only briefly discussed while some modification techniques e.g sandwich holography are not included When needed however the reader is directly referred to complementary publications
