Computational Contact Mechanics Alexander Konyukhov, Karl Schweizerhof, 2012-08-14 This book contains a systematical analysis of geometrical situations leading to contact pairs point to surface surface to surface point to curve curve to curve and curve to surface Each contact pair is inherited with a special coordinate system based on its geometrical properties such as a Gaussian surface coordinate system or a Serret Frenet curve coordinate system The formulation in a covariant form allows in a straightforward fashion to consider various constitutive relations for a certain pair such as anisotropy for both frictional and structural parts Then standard methods well known in computational contact mechanics such as penalty Lagrange multiplier methods combination of both and others are formulated in these coordinate systems

Such formulations require then the powerful apparatus of differential geometry of surfaces and curves as well as of convex analysis. The final goals of such transformations are then ready for implementation: numerical algorithms within the finite element method including any arbitrary discretization techniques such as high order and isogeometric finite elements which are most convenient for the considered geometrical situation. The book proposes a consistent study of geometry and kinematics, variational formulations, constitutive relations for surfaces and discretization techniques for all considered geometrical pairs and contains the associated numerical analysis as well as some new analytical results in contact mechanics.

Provides a comprehensive introduction to the phenomena of particle laden turbulent flow. Explains a wide range of numerical methods including Eulerian, Lagrangian, and volume filtered computation. Describes a wide range of innovative applications of these models.

Computational Contact Mechanics Peter Wriggers, 2006-10-06. Contact mechanics has its application in many engineering problems. No one can walk without frictional contact and no car would move for the same reason. Hence contact mechanics has from an engineering point of view a long history beginning in ancient Egypt with the movement of large stone blocks over rough experimental contributions from leading scientists like Leonardo da Vinci and Coulomb to today's computational methods. In the past contact conditions were often modelled in engineering analysis by more simple boundary conditions since analytical solutions were not present for real world applications. In such cases one investigated contact as a local problem using the stress and strain fields stemming from the analysis which was performed for the entire structure. With the rapidly increasing power of modern computers more and more numerical simulations in engineering can include contact constraints directly which make the problems nonlinear. This book is an account of the modern theory of nonlinear continuum mechanics and its application to contact problems as well as of modern simulation techniques for contact problems using the finite element method. The latter includes a variety of discretization techniques for small and large deformation contact. Algorithms play another prominent role when robust and efficient techniques have to be designed for contact simulations. Finally adaptive

methods based on error controlled finite element analysis and mesh adaptation techniques are of great interest for the reliable numerical solution of contact problems

Modeling Complex Turbulent Flows Manuel D. Salas, Jerry N. Hefner, Leonidas Sakell, 2012-12-06

Turbulence modeling both addresses a fundamental problem in physics the last great unsolved problem of classical physics and has far reaching importance in the solution of difficult practical problems from aeronautical engineering to dynamic meteorology However the growth of supercomputer facilities has recently caused an apparent shift in the focus of turbulence research from modeling to direct numerical simulation DNS and large eddy simulation LES This shift in emphasis comes at a time when claims are being made in the world around us that scientific analysis itself will shortly be transformed or replaced by a more powerful paradigm based on massive computations and sophisticated visualization Although this viewpoint has not lacked articulate and influential advocates these claims can at best only be judged premature After all as one computational researcher lamented the computer only does what I tell it to do and not what I want it to do In turbulence research the initial speculation that computational methods would replace not only model based computations but even experimental measurements have not come close to fulfillment It is becoming clear that computational methods and model development are equal partners in turbulence research DNS and LES remain valuable tools for suggesting and validating models while turbulence models continue to be the preferred tool for practical computations We believed that a symposium which would reaffirm the practical and scientific importance of turbulence modeling was both necessary and timely
