Learnables 1 Learnables:

Computability and Models Barry S. Cooper, 2012-12-06 Science involves descriptions of the world we live in. It also depends on nature exhibiting what we can best describe as a high algorithmic content. The theme running through this collection of papers is that of the interaction between descriptions in the form of formal theories and the algorithmic content of what is described, namely of the models of those theories. This appears most explicitly here in a number of valuable and substantial contributions to what has until recently been known as recursive model theory, an area in which researchers from the former Soviet Union, in particular Novosibirsk, have been pre-eminent. There are also articles concerned with the computability of aspects of familiar mathematical structures and a return to the sort of basic underlying questions considered by Alan Turing in the early days of the subject, an article giving a new perspective on computability in the real world. And of course there are also articles concerned with the classical theory of computability, including the first widely available survey of work on quasi-reducibility. The contributors, all internationally recognised experts in their fields, have been associated with the three-year INTAS RFBR Research Project Computability and Models, Project No 972 139, and most have participated in one or more of the various international workshops in Novosibirsk, Heidelberg, and Almaty, and other research activities of the network.

The 36 revised full papers presented were carefully reviewed and selected from 98 submissions. The papers cover topics such as study of known paradigms, approaches and techniques directed towards their better understanding and utilization, discovery of new paradigms, approaches and techniques that overcome limitations of the existing ones, formulation and treatment of new cryptographic problems, study of notions of security and relations among them, modeling and analysis of cryptographic algorithms, and study of the complexity assumptions used in cryptography.

Practical Iterative Learning Control with Frequency Domain Design and Sampled Data Implementation Danwei Wang, Yongqiang Ye, Bin Zhang, 2014-06-19 This book is on the iterative learning control (ILC) with focus on the design and implementation. We approach the ILC design based on the

frequency domain analysis and address the ILC implementation based on the sampled data methods This is the first book of ILC from frequency domain and sampled data methodologies The frequency domain design methods offer ILC users insights to the convergence performance which is of practical benefits This book presents a comprehensive framework with various methodologies to ensure the learnable bandwidth in the ILC system to be set with a balance between learning performance and learning stability The sampled data implementation ensures effective execution of ILC in practical dynamic systems The presented sampled data ILC methods also ensure the balance of performance and stability of learning process Furthermore the presented theories and methodologies are tested with an ILC controlled robotic system The experimental results show that the machines can work in much higher accuracy than a feedback control alone can offer With the proposed ILC algorithms it is possible that machines can work to their hardware design limits set by sensors and actuators The target audience for this book includes scientists engineers and practitioners involved in any systems with repetitive operations
