

The pump that transports the drilling liquid and ice chips to the chips chamber

The drill head with the three cutters that cut free the ice core

Motor and electronics section

The anti-torque section with three skates that prevent the drill from rotating in the hole

The chips chamber. Drilling liquid runs through the hollow shaft and is recycled, while a mesh retains the chips

The core barrel. The freshly drilled ice core is contained in the core barrel. When the barrel rotates, the spirals on the outside help pumping the drilling liquid and ice chips away from the drill head

*The ice core drill (in the middle) and a closer look at some of the components. The core barrel and chips chamber have been shortened in the drawing and the outer barrel (indicated by green) has been removed to reveal the parts inside*
