Laurent Gosse,2013-03-30 Substantial effort has been drawn for years onto the development of possibly high order numerical techniques for the scalar homogeneous conservation law an equation which is strongly dissipative in L1 thanks to shock wave formation Such a dissipation property is generally lost when considering hyperbolic systems of conservation laws or simply inhomogeneous scalar balance laws involving accretive or space dependent source terms because of complex wave interactions An overall weaker dissipation can reveal intrinsic numerical weaknesses through specific nonlinear mechanisms Hugoniot curves being deformed by local averaging steps in Godunov type schemes low order errors propagating along expanding characteristics after having hit a discontinuity exponential amplification of truncation errors in the presence of accretive source terms This book aims at presenting rigorous derivations of different sometimes called well balanced numerical schemes which succeed in reconciling high accuracy with a stronger robustness even in the aforementioned accretive contexts It is divided into two parts one dealing with hyperbolic systems of balance laws such as arising from quasi one dimensional nozzle flow computations multiphase WKB approximation of linear Schrödinger equations or gravitational Navier Stokes systems Stability results for viscosity solutions of onedimensional balance laws are sketched The other being entirely devoted to the treatment of weakly nonlinear kinetic equations in the discrete ordinate approximation such as the ones of radiative transfer chemotaxis dynamics semiconductor conduction spray dynamics or linearized Boltzmann models Caseology is one of the main techniques used in these derivations Lagrangian techniques for filtration equations are evoked too Two dimensional methods are studied in the context of non degenerate semiconductor models [High Order Nonlinear](#)

Polyhedral Methods in Geosciences Daniele Antonio Di Pietro, Luca Formaggia, Roland Masson, 2021-06-14 The last few years have witnessed a surge in the development and usage of discretization methods supporting general meshes in geoscience applications The need for general polyhedral meshes in this context can arise in several situations including the modelling of petroleum reservoirs and basins CO₂ and nuclear storage sites etc In the above and other situations classical discretization methods are either not viable or require ad hoc modifications that add to the implementation complexity Discretization methods able to operate on polyhedral meshes and possibly delivering arbitrary order approximations constitute in this context a veritable technological jump The goal of this monograph is to establish a state of the art reference on polyhedral methods for geoscience applications by gathering contributions from top level research groups working on this topic This book is addressed to graduate students and researchers wishing to deepen their knowledge of advanced numerical methods with a focus on geoscience applications as well as practitioners of the field

Droplet Interactions and Spray Processes Grazia Lamanna, Simona Tonini, Gianpietro Elvio Cossali, Bernhard Weigand, 2020-03-14 This book provides a selection of contributions to the DIPSI workshop 2019 Droplet Impact Phenomena Spray Investigations as well as recent progress of the Int Research Training Group DROPIT The DIPSI workshop which is now at its thirteenth edition represents an important opportunity to share recent knowledge on droplets and sprays in a variety of research fields and industrial applications The research training group DROPIT is focused on droplet interaction technologies where microscopic effects influence strongly macroscopic behavior This requires the inclusion of interface kinetics and or a detailed analysis of surface microstructures Normally complicated technical processes cover the underlying basic mechanisms and therefore progress in the overall process modelling can hardly be gained Therefore DROPIT focuses on the underlying basic processes This is done by investigating different spatial and or temporal scales of the problems and by linking them through a multi scale approach In addition multi physics are required to

understand e.g. problems for droplet wall interactions where porous structures are involved

Mathematical Aspects of Numerical Solution of Hyperbolic Systems A.G. Kulikovskii, N.V. Pogorelov, A. Yu. Semenov, 2000-12-21 This important new book sets forth a comprehensive description of various mathematical aspects of problems originating in numerical solution of hyperbolic systems of partial differential equations. The authors present the material in the context of the important mechanical applications of such systems including the Euler equations of gas dynamics, magnetohydrodynamics, MHD, shallow water and solid dynamics equations. This treatment provides for the first time in book form a collection of recipes for applying higher order non-oscillatory shock capturing schemes to MHD modelling of physical phenomena. The authors also address a number of original nonclassical problems such as shock wave propagation in rods and composite materials, ionization fronts in plasma and electromagnetic shock waves in magnets. They show that if a small scale higher order mathematical model results in oscillations of the discontinuity structure, the variety of admissible discontinuities can exhibit dispersive behavior including some with additional boundary conditions that do not follow from the hyperbolic conservation laws. Nonclassical problems are accompanied by a multiple nonuniqueness of solutions. The authors formulate several selection rules which in some cases easily allow a correct physically realizable choice. This work systematizes methods for overcoming the difficulties inherent in the solution of hyperbolic systems. Its unique focus on applications both traditional and new makes *Mathematical Aspects of Numerical Solution of Hyperbolic Systems* particularly valuable not only to those interested in the development of numerical methods but to physicists and engineers who strive to solve increasingly complicated nonlinear equations.

Snapshot-Based Methods and Algorithms Peter Benner, et al., 2020-12-16 An increasing complexity of models used to predict real world systems leads to the need for algorithms to replace complex models with far simpler ones while preserving the accuracy of the predictions. This two volume handbook covers methods as well as applications. This second volume focuses on applications in engineering, biomedical engineering, computational physics and computer science.

Parallel Computational Fluid Dynamics 2001, Practice and Theory P. Wilders, P. Fox, A. Ecer, N. Satofuka, Jacques Periaux, 2002-04-17 ParCFD 2001, the thirteenth international conference on Parallel Computational Fluid Dynamics, took place in Egmond aan Zee, the Netherlands, from May 21-23, 2001. The specialized high level ParCFD conferences are organized yearly on traveling locations all over the world. A strong back up is given by the central organization located in the USA: <http://www.parcfd.org>. These proceedings of ParCFD 2001 represent 70% of the oral lectures presented at the meeting. All published papers were subjected to a refereeing process which resulted in a uniformly high quality. The papers cover not only the traditional areas of the ParCFD conferences, e.g. numerical schemes and algorithms, tools and environments, interdisciplinary topics, industrial applications, but following local interests also environmental and medical issues. These proceedings present an up to date overview of the state of the art in parallel computational fluid dynamics.
