Development and Application of the Finite Element Method based on MatLab Herbert

Baaser, 2010-05-10 The intention of this booklet is a brief but general introduction into the treatment of the Finite Element Method FEM The FEM has become the leading method in computer oriented mechanics so that many scientific branches have grown up besides over the last decades Nevertheless the FEM today is a question of economy On the one hand its industrial application is forced to reduce product development costs and time on the other hand a large number of commercial FEM codes and a still growing number of software for effective pre and postprocessors are available in the meantime Due to that today it is a quite challenging task to operate with all these different tools at the same time and to understand all handling and solution techniques developed over the last years So we want to help in getting a deeper insight into the main interfaces between the customers of the FEM and the codes itself by providing a totally open structured FE code based on Matlab which is a very powerful tool in operating with matrix based formulations That idea and conditions forced us some years ago to initiate DAEdalon as a tool for general FE developments in research applications In spite of still existing high sophisticated mostly commercial FE codes the success and the acceptance of such a structured tool justify that decision afterwards more and more

Finite Element Analysis of Structures through Unified Formulation Erasmo

Carrera, Maria Cinefra, Marco Petrolo, Enrico Zappino, 2014-07-29 The finite element method FEM is a computational tool widely used to design and analyse complex structures Currently there are a number of different approaches to analysis using the FEM that vary according to the type of structure being analysed beams and plates may use 1D or 2D approaches shells and solids 2D or 3D approaches and methods that work for one structure are typically not optimized to work for another Finite Element Analysis of Structures Through Unified Formulation deals with the FEM used for the analysis of the mechanics of structures in the case of linear elasticity The novelty of this book is that the finite elements FEs are formulated on the basis of a class of theories of structures known as the Carrera Unified Formulation CUF It formulates 1D 2D and 3D FEs on the basis of the same fundamental nucleus that comes from geometrical relations and Hooke's law and presents both 1D and 2D refined FEs that only have displacement variables as in 3D elements It also covers 1D and 2D FEs that make use of real physical surfaces rather than artificial mathematical surfaces which are difficult to interface in CAD CAE software Key features Covers how the refined formulation can be easily and conveniently used to analyse laminated structures such as sandwich and composite structures and to deal with multifield problems Shows the performance of different FE models through the best theory diagram which allows different models to be compared in terms of accuracy and computational cost

Introduces an axiomatic asymptotic approach that reduces the computational cost of the structural analysis without affecting the accuracy Introduces an innovative component wise approach to deal with complex structures Accompanied by a website hosting the dedicated software package MUL2 www.mul2.com Finite Element Analysis of Structures Through Unified Formulation is a valuable reference for researchers and practitioners and is also a useful source of information for graduate students in civil mechanical and aerospace engineering

Consistent Higher Order Accurate Time Discretization Methods for Inelastic Material Models Schröder, Bettina Anna Barbara, 2020-01-20 The present thesis investigates the usage of higher order accurate time integrators together with appropriate error estimators for small and finite dynamic visco plasticity Therefore a general visco plastic problem is defined which serves as a basis to create closed form solution strategies A classical access towards small and finite visco plasticity is integrated into this concept This approach is based on the idea that the balance of linear momentum is formulated in a weak sense and the material laws are included indirectly Thus separate time discretizations are implemented and an appropriate coupling between them is necessary Limitations for the usage of time integrators are the consequence In contrast an alternative multifield formulation is derived adapting the principle of Jourdain The idea is to assume that the balance of energy taking into account a pseudopotential representing dissipative effects resembles a rate type functional whose stationarity condition leads to the equations describing small or finite dynamic visco plasticity Accordingly the material laws and the balance of linear momentum can be solved on the same level and only one single time discretization has to be performed A greater freedom in the choice of time integrators is obtained and the application of higher order accurate schemes such as Newmark's method fully implicit as well as diagonally implicit Runge Kutta schemes and continuous as well as discontinuous Galerkin methods is facilitated An analysis and a comparison of the classical and the multifield formulation is accomplished by means of distinct examples In this context a dynamic benchmark problem is developed which allows to focus on the effect of different time integrators For this investigation a variety of time discretization error estimators are formulated evaluated and compared

Fundamentals of the Finite Element Method for Heat and Fluid Flow Roland W. Lewis, Perumal Nithiarasu, Kankanhalli N. Seetharamu, 2004-07-16 Heat transfer is the area of engineering science which describes the energy transport between material bodies due to a difference in temperature The three different modes of heat transport are conduction convection and radiation In most problems these three modes exist simultaneously However the significance of these modes depends on the problems studied and often insignificant modes are neglected Very often books published on Computational Fluid Dynamics using the Finite Element Method give very little or no significance to thermal or heat transfer problems From the research point of view it is important to explain the handling of various types of heat transfer problems with different types of complex boundary conditions Problems with slow fluid motion and heat transfer can be difficult problems to handle Therefore the complexity of combined fluid flow and heat transfer problems should not be underestimated and should be dealt with carefully This book Is ideal for teaching senior undergraduates the fundamentals of how to use the Finite Element Method to solve heat transfer and fluid dynamics problems Explains how to solve various heat transfer problems with different types of boundary conditions Uses recent computational methods and codes to handle complex fluid motion and heat transfer problems Includes a large number of examples and exercises on heat transfer problems In an era of parallel computing computational efficiency and easy to handle codes play a major part

Bearing all these points in mind the topics covered on combined flow and heat transfer in this book will be an asset for practising engineers and postgraduate students Other topics of interest for the heat transfer community such as heat exchangers and radiation heat transfer are also included

A New Kirchhoff-Love Beam Element and its Application to Polymer Mechanics Matthias C. Schulz,2022-09-21 The novel finite element formulations fall into the category of geometrically exact Kirchhoff Love beams A prominent characteristic of this category is that the absence of shear deformation is strongly enforced by removing two degrees of freedom Further the corresponding beam theories exhibit not only translational but also rotational degrees of freedom and their configurations thus form a non additive and non commutative space Sophisticated interpolation schemes are required that need to be tested not only for locking spatial convergence behavior and energy conservation but also for observer invariance and path independence For the three novel beam element formulations all these properties are analytically and numerically studied and confirmed if applicable Two different rotation parameterization strategies are employed based on the well known geodesic interpolation used in many Simo Reissner beams and the lesser known split into the so called textit smallest rotation and a torsional part Application of the former parameterization results in a mixed finite element formulation intrinsically free of locking phenomena Additionally the first geometrically exact Kirchhoff Love beam element is presented which strongly enforces inextensibility by removing another degree of freedom Furthermore the numerical efficiency of the new beam formulations is compared to other beam elements that allow for or suppress shear deformation When modeling very slender beams the new elements offer distinct numerical advantages Standard molecular dynamics simulations which are commonly used to study polymers suffer from a lack of a careful mathematical basis and the use of an expensive explicit time integration scheme To circumvent these shortcomings and to be able to simulate stretching experiments on relevant time scales the problem is described by a stochastic partial differential equation which can be solved using the finite element method with a backward Euler temporal discretization In detail the polymer is represented by a Kirchhoff Love beam with a linear elastic constitutive model Inertial and electrostatic forces are neglected It is deformed by a distributed load mimicking collisions with molecules of the surrounding fluid Naturally this load heavily fluctuates over time and space and mean values need to be computed in a Monte Carlo manner To vastly speed up the fitting process to experimental data in a Bayesian framework a surrogate model based on a Gaussian process is set up which directly computes the mean values for given material parameters The uncertainties and correlations of the material parameters are studied and compared to the literature
